

HUMAN BACKSTORY

Dark psychology direction. Near-black ground with grain and vignette, monochrome type, a single red accent read as a wound. The fracture in the O is the mark.

01 PRIMARY WORDMARK

HUMAN BACKSTORY

Barlow Condensed 900, uppercase, near-flush tracking. The O in BACKSTORY is cut and offset four units, with a tapered red hairline in the gap. One accent, structural rather than decorative.

LEGIBILITY AT RENDER SIZES

98

48

24

At 24px the seam collapses to a single pixel of red and the ring still reads as broken. The mark is the same construction as the O in the wordmark, so the two reinforce each other.

HUMAN BACKSTORY

"WHY ARE HUMANS LIKE THIS?"

Wordmark and tagline sit inside the 1546×423 safe area, so nothing crops on mobile or TV. Beyond it, the constellation trace and vignette carry the desktop width — atmosphere only, no information. Grain sits over everything as the final layer.

TYPE & ACCENT

#F2F2F3

#C0413F — one accent

TYPEFACE

BARLOW CONDENSED
900

Wordmark, thumbnail text, evidence labels,
on-screen AI text. Uppercase throughout.

CLEAR SPACE

1× cap height

Minimum margin on all four sides of the
wordmark. Never place the mark on a flat field
— ground always carries grain.

Title: Why are Human Babies Born So Useless Next to Chimpanzees. Thumbnail text names the sensation, not the mechanism, so the two layers don't duplicate.

BORN UNFINISHED

 HUMAN BACKSTORY

One red accent, spent on the fracture rather than a word. Subject sits right and cropped, text holds the negative space left. Drop the photograph into the slot — hard single-side light, no saturation, B&W or cold duotone.

Title: Why Your Body Secretly Kept the Fur You Thought You Lost. Same construction as 05 — big word, qualifier under it, fracture through the frame, mark bottom-left. The series reads as a set at feed scale.

STILL ON YOUR SKIN

 HUMAN BACKSTORY

The fracture mirrors 05 rather than repeating it, so consecutive uploads don't look like the same file. Subject brief: forearm or shoulder skin, raking side light so the fine vellus hair catches as a rim — the thing the title says you still have.

Title: Why You Are Wired to Never Let Go. The subject is the open loop, so the frame device is a ring that almost closes instead of a fracture — same family as the channel mark, different sensation.

IT NEVER CLOSED

 HUMAN BACKSTORY

Mirrored from 05 and 06 — subject left, type right — so three consecutive uploads don't sit the same way in the feed. Two concentric rings, each with a gap that never joins — the loop the mind keeps running. They sit at low opacity so the red word stays the only loud thing. Subject brief: a face half in shadow, eyes open and lit, looking past the lens rather than at it.

Title: Why we can't remember the first years of our lives. Back to subject right, type left — alternating with 07. The device is a missing run in a timeline: the memory isn't faint, it was never written.

YOU WERE TOLD

 HUMAN BACKSTORY

A tick-marked timeline runs the width of the frame, but the first stretch is a broken red line ending in a hard stop — nothing was recorded there. YOU WERE TOLD carries the second half of the premise: the memory you have is secondhand. Subject brief: a hand holding an old snapshot of a child, or a toddler's face just out of focus.

Title: Why Your Lower Back Never Forgives You for Standing Upright. Subject left, type right — alternating with 08.
The hook is a verdict on the viewer's own body: two words, no explanation, so the click is the only way to find out why.

BUILT WRONG

 HUMAN BACKSTORY

A column of vertebra ticks follows the spine's S-curve down the seam between photo and type. The lumbar three turn red and split — the exact spot the title is about. Subject brief: a bare back from behind, hard side light carving the spine, a hand pressed to the lower back.

Title: Why Your Brain Makes Rejection Hurt So Much. Text locked to the left third, subject filling the right two thirds.
HURTS stays whole, with its lower edge chipped away and red glass fragments falling beneath it.

IT STILL HURTS

 HUMAN BACKSTORY

The bottom of each letter is broken off along a jagged line; the missing pieces fall below in three tones of the one red so they read as glass facets, thinning out as they drop. Subject brief: a person alone, head lowered into one hand, hard side light.
